

MXF for Production – AS-10

AMWA Application Specification

- MXF for Production, AS-10, is an MXF file format that facilitates the use of long GOP encoded video in end-to-end production workflows.
- AS-10 builds on the SMPTE RDD 9: *The MXF Interoperability Specification of Sony MPEG Long GOP Products*.
- The file format allows the editing of growing files—read during write. It also supports spanning of a recording across several files, and adds support for Descriptive Metadata.
- AMWA members will have access to a validator and compliance tools as well as Golden Master files.

- The AMWA Application Specifications define a set of rules that constrain a standard—like MXF—to suit a particular use
- An Application Specification can be further constrained to meet the needs of a user through the use of a “shim”

Questions about AS-10

► What is AS-10?

- » AS-10 is a file format for media companies who want to use long GOP MPEG files from acquisition through to distribution & delivery.
- » A constrained version of MXF OP1a, based on Sony XDCAM RDD9

► Who should use AS-10?

- » Broadcasters who shoot in the XDCAM format, and would like to use the same file format from acquisition to air.

► Why use AS-10?

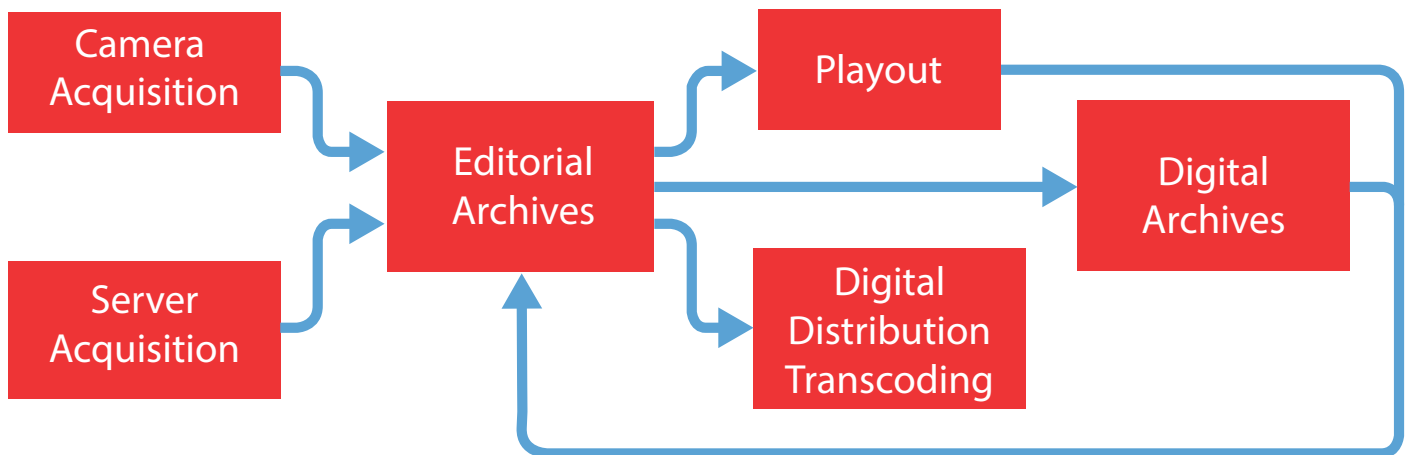

- » Transcoding adds delay to fast-turnaround workflows like news production.
- » The concatenation of different codecs for acquisition, editing, playout and archive inevitably leads to picture quality degradation.

► Will AS-10 help with interoperability?

- » One deliverable from the project is a validation tool for subscribers to check their media as part of a QA process. This is available to AMWA members

► Technical Specifications

- » Video coding: MPEG-2 long GOP MP@ML and 422@HL
- » Audio coding: multi-channel PCM
- » Descriptive metadata is an option, configure as a subset of SMPTE EG 42:200

A single file format can traverse the entire production workflow

Status: AS-10 version 1.0 released
